* **Photoshop Elements:** It is used for creating and editing photos in a digital darkroom, similar to those of the early days of the photographic industry. This program is good for beginners, creating basic photos for Web sites and social media websites, and for social networking. It lacks many advanced editing features as well as photo-editing tutorials that are useful for your editing projects. * **Adobe Photoshop:** It's really the flagship software for Photoshop. It is used in the photo-editing industry, especially for high-end retouching and photo composites. It has a vast collection of tools used to edit raster images, and an extensive web of Photoshop tutorials are available online. It is the industry standard for photo work and will get you started in this area. * **Lightroom:** It's similar to Photoshop but has a different interface. It is used in the same way and with the same market and tutorial expertise. It is more user-friendly than Photoshop for beginners and provides a nice alternative program if you don't want to invest in Photoshop. It also works with the latest Apple products in addition to Windows. Lightroom is good for basic and professional photo-editing work as well as importing, organizing, and cataloging images.

What's New in the?

The present invention relates to a process for the separation of acetic acid from acetaldehyde in a zeolite catalyst by reaction at a low temperature in a fixed bed, wherein a mixture of acetic acid and acetaldehyde is continuously fed into the reaction zone, the product is continuously withdrawn from the reaction zone while cooling the effluent from the reaction zone, a gas stream containing hydrogen and steam is passed through the catalyst at a temperature of from about 200.degree. to about 400.degree. C., and acetic acid and acetaldehyde are separated from the effluent under a temperature of about 100.degree. to about 200.degree. C. It is known to react acetic acid and acetaldehyde in the presence of a zeolite catalyst under a hydrogen atmosphere, in order to separate acetic acid and acetaldehyde from each other. In the reaction, a mixture of acetic acid and acetaldehyde is fed into the reactor, and the reaction products are continuously withdrawn from the reactor. The reaction in the reactor is carried out under a pressure of from 1 to 10 atmospheres and with a reaction temperature of from 100.degree. to 400.degree. C. For example, U.S. Pat. No. 3,865,877 teaches the separation of acetic acid from acetaldehyde in a hydrogen atmosphere, and German Patent No. 952,501 teaches a process for the production of acetic acid wherein a mixture of acetic acid and acetaldehyde is reacted in a fixed bed in the presence of a zeolite catalyst. Acetaldehyde is generally present in the reaction mixture as a by-product in the preparation of acetic acid. On the other hand, acetic acid generally is present in the reaction mixture in the form of about 90 percent as the free acetic acid, the remainder being combined with water to form an aqueous solution of acetic acid. In the processes for producing acetic acid from a gaseous mixture comprising acetic acid and acetaldehyde, in which a catalytic reaction is carried out in the presence of a zeolite catalyst, the process is conducted under a reaction pressure of from 1 to 10 atmospheres and a reaction temperature of from 200.degree. to 400.degree. C. with an hourly space velocity of from 0.01 to 100 hr.sup.-1. However, the acetic acid is recovered as a liquid phase. If the reaction is carried out under reaction conditions of a higher temperature and a higher reaction pressure, then it
