Construction of cassia seedlings raised in salt affected soils of Bangladesh and China. Cassia sinesis L., a Chinese yam, is widely cultivated in arid and semi-arid regions, especially in northern China. Under salt stress conditions, cassia seedlings can cause salt stress resistance problems for the farmers to grow up and lead to the decrease in cassia crop yield. However, the mechanisms of salt stress resistance in cassia seedlings are largely unknown. For exploring the salt stress resistance of cassia seedlings, we constructed cassia seedlings by using Gengnian No. 11 and Gengnian No. 22, which were cultivated in the salt affected soils of Bangladesh and China. The results showed that cassia seedlings could improve the salt stress tolerance of plants under the salt stressed condition. The salt resistance mechanisms in cassia seedlings included improving antioxidative defense system, reducing content of H_2O_2 and MDA, improving the osmotic adjustment ability and activities of antioxidant enzymes, and the regulation of the antioxidant ability. The performance of cassia seedlings was better in the soil of China. This study provides important insights into the salt stress resistance of cassia and lays a foundation for the production of cassia seeds in salt affected soils.Q: Using jQuery to add dynamically fields with event handlers I'm trying to create a dynamic form in which the user can add on each new row idk how to explain it so I'll paste a short example of what I'm trying to do. I have a list of products, that when you click on it a new row is added to the screen

which when clicked adds fields to that row. The fields don't have a source, what I thought was to add an ID to the fields, for example id: product_id, name: product_name and data-name: product_id, I have an associative array with the Product ids that I have. So now I want to add a handler to the new row, so when the user clicks on the row I need to add the fields, and then to have the click event of the row and add a function to the click of the fields from the row I clicked on, so the user would type in some text. I have tried making my own jQuery plugin and have a factory method that adds an event to the row, but I'm stuck in how to dynamically add the fields. A: you could setup the data
