Photoshop is currently available for Windows, Macintosh, and Unix operating systems and has its own line of Photoshop Portable software for the palmtop PDA platform. Photoshop is a

general-purpose raster graphics editor. It combines still image editing, layer-based bitmap image composition, and digital illustration. Other features include image retouching and manipulation, page layout, and page prepress, including color management. Some other features include capabilities for transferring files to other file formats, creation of digital drawing standards, compositing multiple images and one-layer images into images with a color depth of 8, 16, 24, or 32 bits, and the ability to import or export to a variety of file formats including.GIF,.JPEG,.TIF,.BMP,.PDF,.EMF,.WMF,.MIF,.JFIF,.PCD, and.CALS. Photoshop is primarily composed of a set of tools organized into "panels". The panels are divided into "main" panels which provide basic editing and retouching operations, and "layers" panels which provide options and controls to organize, display, and manage layers. Photoshop has both a command-driven interface and a graphical interface. Each workstation has a full-screen view of

the image which is manipulated with the keyboard and mouse. Photoshop also includes a variety of "hot keys" to allow more efficient data entry and image manipulation. Photoshop may be used as a content-aware fill, and a series of filters are available to perform various image effects. Features are available for photographic effects, such as the adjustments to light and dark areas in a photograph, image warping, and color correction, and for special effects, such as the removal of scratches and defects in a digital photograph, generation of the effect of a Polaroid photo, the creation of photographic composites, the creation of realistic looking textures and patterns, and simulations of film processing and black-

DnsEye has been created as a simple alternative to monitor the network traffic on a system, DNS (Domain Name System) packets in particular, and run a reverse lookup in order to provide the domain names. The product is designed with a simple interface that does not require any interaction from the user. The layout is clear and intuitive, with the action buttons for starting and stopping the process being visible in the upper part of the screen. The information captured from the network is shown in the lower part of the application window and includes the DNS names and the details about the time of their occurrence (complete date and time stamp). Easy to work with Since the program detects the local interface automatically, users do not have too much input in the process except for starting and stopping the operation. Once the list begins to be populated, users have the possibility to open the links in the default

web browser as well as to save them into a local file (plain text). Working with the program should not be a tough job and its activity should provide valuable insight about the web sites that have been visited and the servers contacted during regular web browsing sessions. However, during our testing we noticed that it returns an error message as soon as started, unless it runs with elevated privileges. As such, we recommend running it as an administrator. The simplest way to ensure this without decreasing the security level on the entire system is to install it with administrator privileges. Alternatively, the privilege level in the compatibility settings, under the properties of the executable file can be changed after installation. Conclusion DnsEye is extremely simple and provides a good view of the domains that are contacted while browsing the web. DnsEye Pros: ✓ Simple interface ✓ Capture full domain names ✓ Captures URLs ✓ Records domain names and their details ✓ Captures data

about the source and destination IP addresses ✓ Works with the local interface and with the global interface ✓ Captures the traffic ✓ Captures the Netmask ✓ Captures the MAC address ✓ Automatically recognizes the installed interfaces ✓ Can be used for web monitoring ✓ Records the time of the appearance of a domain name ✓ Supports reverse lookup ✓ Supports the wildcard ✓ Shows the size of the captured traffic ✓ Can be used as admin-level application ✓ Works with the latest versions of Windows ✓ May be run from any directory ✓ May be operated
