Q: Does isopropylamine have some pharmacological activity? I am always wary about naming products that have not been tested for pharmacological activity, and isopropylamine, in particular. Does this compound have some pharmacological activity or is it just a nasty tasting byproduct? A: I was able to find a few studies on isopropylamine, both as racemic mixture and as the (1R,2S)-isomer. No evidence of pharmacological activity has been found in any of these studies. See also Isopropyl Amine as Food Flavor and As Food Perfume Research has not been conducted in humans, but the isomer is used in the pharmaceutical industry and in the food industry in perfume, in chewing gum, and as a flavor in fish or vegetable dishes. Isopropylamine is toxicologically inert and has been used as an acid-releasing agent in meat tenderizing agents. The no-observed-adverse-effect level in rats is 1,000 mg/kg. It is used in analytical chemistry as a catalyst for the preparation of tert-butyl methyl ether and tert-butyl ether from tert-butyl alcohol. Isopropyl amine is the single most efficient

---

catalyst for etherification of tert-butyl alcohol at room temperature. A full transformation of tert-butyl alcohol to the tert-butyl ether in three hours requires a 60-fold excess of tert-butyl alcohol over catalyst, whereas only a 15-fold excess is required over the more hindered methyltrialkoxysilanes. ... In order to study the reaction mechanism of this transformation, the reactivity of the hydroxyl group in tert-butyl alcohol in etherification was compared with that of the oxygen atom of the methoxy group. It was discovered that tert-butyl alcohol and methoxy compounds are good substrates for the catalytic etherification reaction. These reactions involved elimination of both hydrogen and oxygen atoms, which proves that the reaction was nucleophilic addition of methoxy compounds.
