Symplectic and non-symplectic deformations for some pairs of symplectic or contact fibrations. Symplectic and contact topological fibrations have been shown to be an interesting class of manifolds. In the case of contact fibrations, the conjecture that the contact structure, minus the trivial co-orientation, must be part of the fibration has been proved for the class of so-called Calabi-Eliashberg fibrations. In this paper we consider deformations of two kinds of fibrations. The first are deformations of the original fibration that preserve the symplectic structure and the second are deformations that preserve the contact structure. In the first case, we provide a complete proof of the conjecture for those fibrations where the total space of the fibration is diffeomorphic to a product with compact factors. The second case, in which the total space is a product with non-compact factors, is based on a geometric construction, which we exploit to prove that the complement of the symplectic or contact structure in the total space cannot be trivial.
